

Relativity

Lite

Prof. Ricardo Eusebi
Physics Department of Texas A&M University

A brief introduction to :

- × *Special Relativity*
- × *General Relativity*

Intuition and common sense in Relativity

- You on land, friend driving train. Tell you friend to turn the lights on 10 seconds after passing stop A.

- What happens if we just increase the velocity of the train to, say $V=3/4c$?

Intuition and common sense in Relativity

- You on land, friend driving train. Tell you friend to turn the lights on 10 seconds after passing stop A.

- What happens if we just increase the velocity of the train to, say $V = \frac{3}{4}c$?

Intuition and common sense in Relativity

- You on land, friend driving train. Tell you friend to turn the lights on 10 seconds after passing stop A.

- What happens if we just increase the velocity of the train to, say $V = \frac{3}{4}c$?

- What happens if we just increase the velocity of the train to, say $V = \frac{3}{4}c$?

This effect was theoretically predicted before any experiment confirmed it!!
 To understand this we need to go back to the times of Galileo

Physics before Einstein

Principle of Relativity: All states of uniform motion are equivalent for the description of physical phenomena

Physics before 1900's:

➤ **It was assumed:** $x' = x - V \times t$

$t' = t$ ← **Absolute time !**

This is a Galilean transformation

➤ **Consequences:**

1. Applying this to a velocity v' we obtain:

$$v' = v - V$$

Transformation of velocities
Velocities can go up to infinity!

2. Waves:

Physics before 1900's:

➤ **It was assumed:** $x' = x - V \times t$

$$t' = t \quad \leftarrow \text{Absolute time !}$$

This is a Galilean transformation

➤ **Consequences:**

1. Applying this to a velocity \mathbf{v}' we obtain:

$$\mathbf{v}' = \mathbf{v} - \mathbf{V}$$

Transformation of velocities
Velocities can go up to infinity!

2. Waves:

According to Galilean transformations:

- what looks like a wave in one r.f. does not look like a wave in another.
- to talk about waves one must specify a reference frame,

A Problem Arises

The problem: electromagnetism (light)

➤ Electromagnetic waves

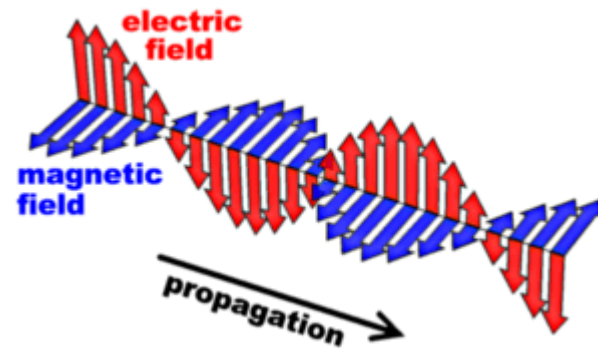

- Maxwell wrote the basic theory in 1860's
- Heinrich Hertz sent and received radio waves in 1890's
- Radio waves predicted and measured to move with the speed of light!

Problem:

Maxwell equations are not invariant to Galilean transformations of r.f.

➤ Three options:

- Maxwell equations are wrong.
- Galilean transformations are wrong.
- The relativity principle is wrong for light.
Is there an ether through which light propagates ?

The solution, by Albert Einstein

➤ **Three options:**

- Maxwell equations are wrong.
- Galilean transformations are wrong.
- The relativity principle is wrong for light.
Is there an ether through which light propagates ?

➤ **He postulated:**

- *Principle of relativity is valid.*

The principle of Relativity is symmetrically nice. Only ether could violate it, but the ether has not been found.

- *The velocity of light (in vacuum) is the same in all r.f.'s*

Maxwell equations predict the velocity of light, which has been measured to be the same as predicted. Maxwell is right and the velocity of light is the same regardless the r.f. from which we look.

➤ **Three options:**

- ~~Maxwell equations are wrong.~~
- Galilean transformations are wrong.
- ~~The relativity principle is wrong for light.~~
~~Is there an ether through which light propagates ?~~

➤ **He postulated:**

- *Principle of relativity is valid.*

The principle of Relativity is symmetrically nice. Only ether could violate it, but the ether has not been found.

- *The velocity of light (in vacuum) is the same in all r.f.'s*

Maxwell equations predict the velocity of light, which has been measured to be the same as predicted. Maxwell is right and the velocity of light is the same regardless the r.f. from which we look.

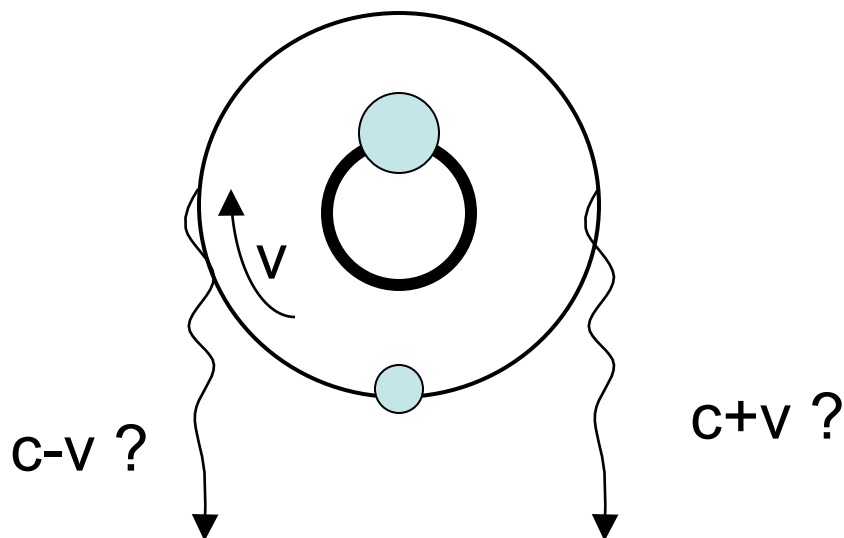

Einstein Postulates

- Today we can experimentally test these postulates
 - No law has ever been seen different, in different reference frames.

- Today we can experimentally test these postulates
 - No law has ever been seen different, in different reference frames.
 - Constancy of the velocity of light in any frame is **VERIFIED!**

In double stars

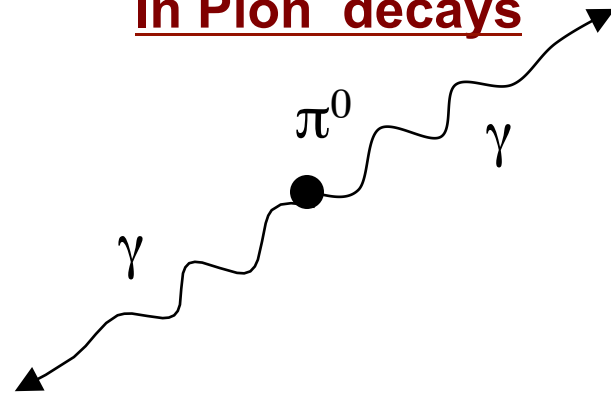

Einstein Postulates

 - Constancy of the velocity of light in any frame is **VERIFIED!**

In double stars

In Pion decays

- In r.f. S' we make a clock based on light.

- In r.f. S' we make a clock based on light.

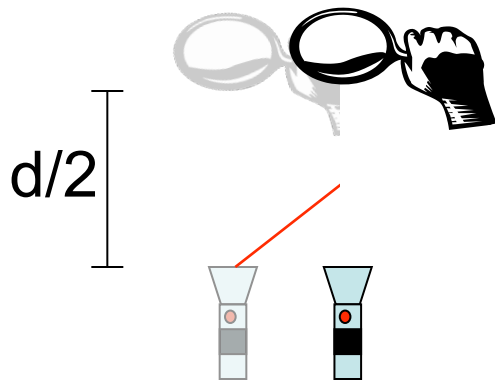

- From the r.f. S (moving w.r.t. to S') we may see this differently

- In r.f. S' we make a clock based on light.

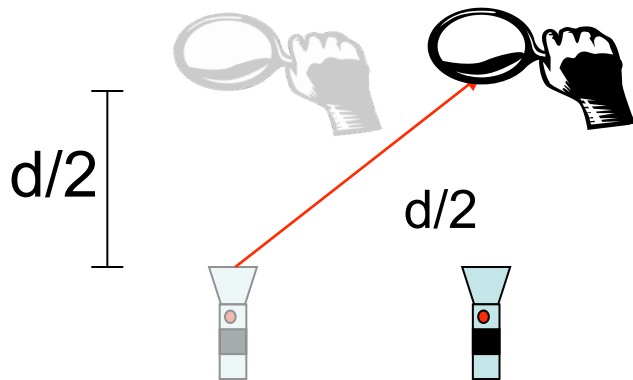

- From the r.f. S (moving w.r.t. to S') we may see this differently

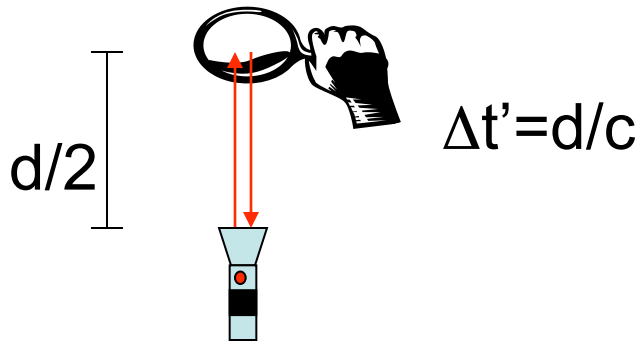

- In r.f. S' we make a clock based on light.

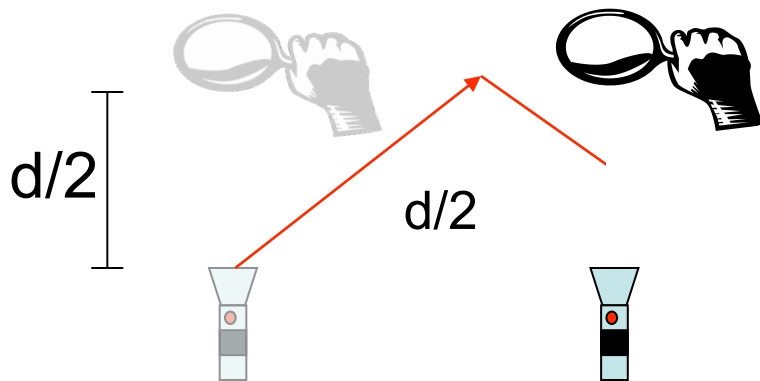

- From the r.f. S (moving w.r.t. to S') we may see this differently

- In r.f. S' we make a clock based on light.

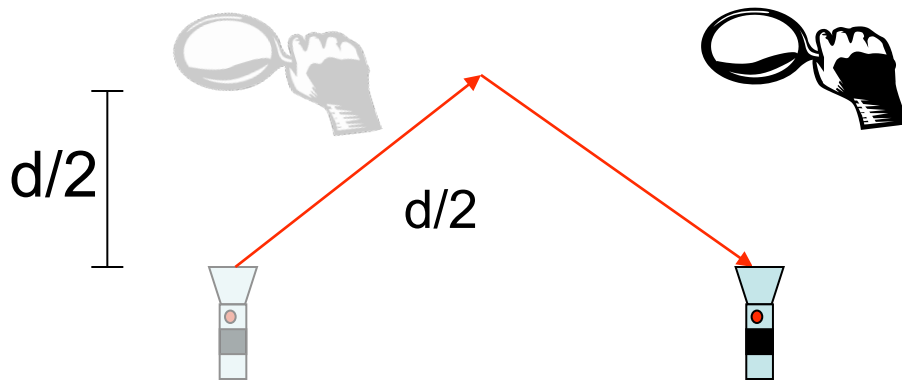

- From the r.f. S (moving w.r.t. to S') we may see this differently

- In r.f. S' we make a clock based on light.

- From the r.f. S (moving w.r.t. to S') we may see this differently

Time in Relativity

- In r.f. S' we make a clock based on light.

- From the r.f. S (moving w.r.t. to S') we may see this differently

Time in Relativity

- In r.f. S' we make a clock based on light.

- From the r.f. S (moving w.r.t. to S') we may see this differently

Moving clocks run slower than to non-moving clocks !!!

About swimming on the water

- Basic idea: swim 20 meters (measured from ground) back and forth
 - Still waters: $T_{\text{long}} = T_{\text{perp}}$

About swimming on the water

- Basic idea: swim 20 meters (measured from ground) back and forth
 - Still waters: $T_{\text{long}} = T_{\text{perp}}$
 - With flow $T_{\text{long}} > T_{\text{perp}}$

About swimming on the water

- Basic idea: swim 20 meters (measured from ground) back and forth
 - Still waters: $T_{\text{long}} = T_{\text{perp}}$
 - With flow $T_{\text{long}} > T_{\text{perp}}$

If two identical swimmers were to reach the original position at the same time it would mean that swimmer going longitudinally travelled a smaller distance!

- Clock with two arms of the same length.

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

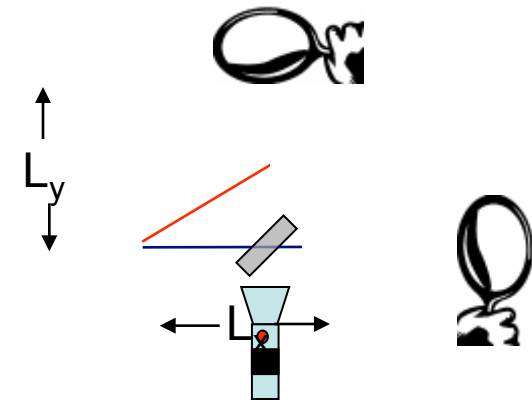

- From a r.f. moving w.r.t. to S, we see this differently

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

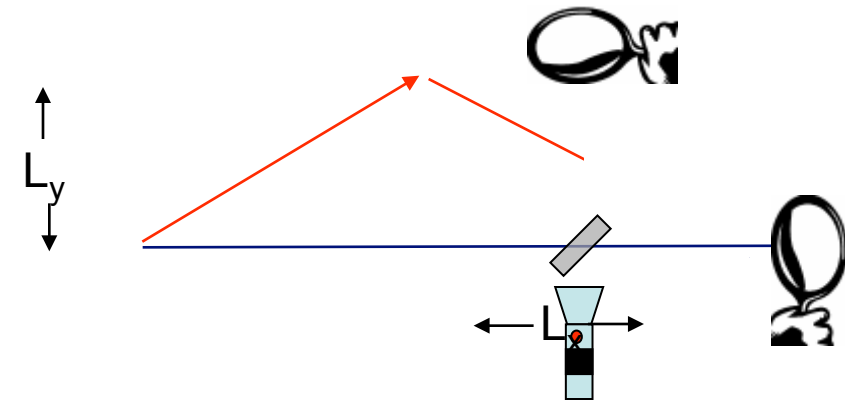

Space in Relativity

- Clock with two arms of the same length.

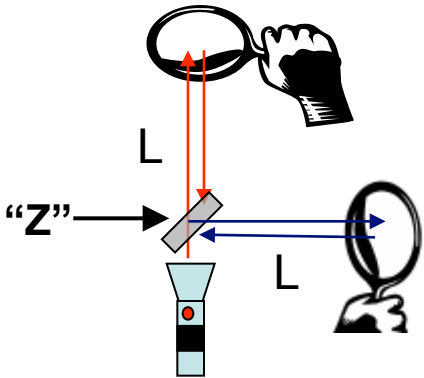

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

Space in Relativity

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

Notes:

1. Here again, reflected light from both mirrors reach the point "Z" at the same time
2. Light travels both paths at same velocity, c .
3. Thus, paths must be equal.

Space in Relativity

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

Notes:

1. Here again, reflected light from both mirrors reach the point "Z" at the same time
2. Light travels both paths at same velocity, c .
3. Thus, paths must be equal.

Distance traveled by light can only be equal if $L_x < L_y$

Space in Relativity

- Clock with two arms of the same length.

Reflected light from both mirrors reach the point "Z" at the same time

- From a r.f. moving w.r.t. to S, we see this differently

Notes:

1. Here again, reflected light from both mirrors reach the point "Z" at the same time
2. Light travels both paths at same velocity, c .
3. Thus, paths must be equal.

Distance traveled by light can only be equal if $L_x < L_y$

Moving Lengths look shorter !!!

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.
- Muon at rest

$$t' = t'_0$$

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.
- Muon at rest

$$t' = t'_0 + 1 \mu\text{s}$$

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.
- Muon at rest

$$t' = t'_0 + 2 \mu\text{s}$$

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.
- Muon at rest

$$t' = t'_0 + 2 \mu\text{s}$$

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.

- Muon at rest

$$t' = t'_0 + 3 \mu\text{s}$$

Time dilation is proven every day

➤ Muons are particles that decay (on average) every $2 \mu\text{s}$.

➤ Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

Time dilation is proven every day

➤ Muons are particles that decay (on average) every $2 \mu\text{s}$.

➤ Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

➤ Muon moving at $V=0.98c$

According to Galilean transformations if the muon is moving at $V=0.98c$ we'll see it disintegrating at

$$x = 0.98c \times 2 \mu\text{s} = 1.96 \text{ Km}$$

Time dilation is proven every day

➤ Muons are particles that decay (on average) every $2 \mu\text{s}$.

➤ Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

➤ Muon moving at $V=0.98c$

According to Galilean transformations if the muon is moving at $V=0.98c$ we'll see it disintegrating at

$$x = 0.98c \times 2 \mu\text{s} = 1.96 \text{ Km}$$

Time dilation is proven every day

➤ Muons are particles that decay (on average) every $2 \mu\text{s}$.

➤ Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

➤ Muon moving at $V=0.98c$

According to Galilean transformations if the muon is moving at $V=0.98c$ we'll see it disintegrating at

$$x = 0.98c \times 2 \mu\text{s} = 1.96 \text{ Km}$$

Time dilation is proven every day

Time dilation is proven every day

- Muons are particles that decay (on average) every $2 \mu\text{s}$.

- Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

- Muon moving at $V=0.98c$

According to Galilean transformations if the muon is moving at $V=0.98c$ we'll see it disintegrating at

$$t = t_0 + 15 \mu\text{s}$$

$$x = 0.98c \times 2 \mu\text{s} = 1.96 \text{ Km}$$

Time dilation is proven every day

➤ Muons are particles that decay (on average) every $2 \mu\text{s}$.

➤ Muon at rest

$$t' = t'_0 + 4 \mu\text{s}$$

➤ Muon moving at $V=0.98c$

According to Galilean transformations if the muon is moving at $V=0.98c$ we'll see it disintegrating at

Time dilation in muons

Muon traveling at $0.98c$ down the atmosphere

➤ As viewed in the earth reference frame

- The landscape has its normal size.
- If muons had size → is flattened like a pancake.
- Muon's clock run 5 times slower.

Time dilation in muons

Muon traveling at 0.98c down the atmosphere

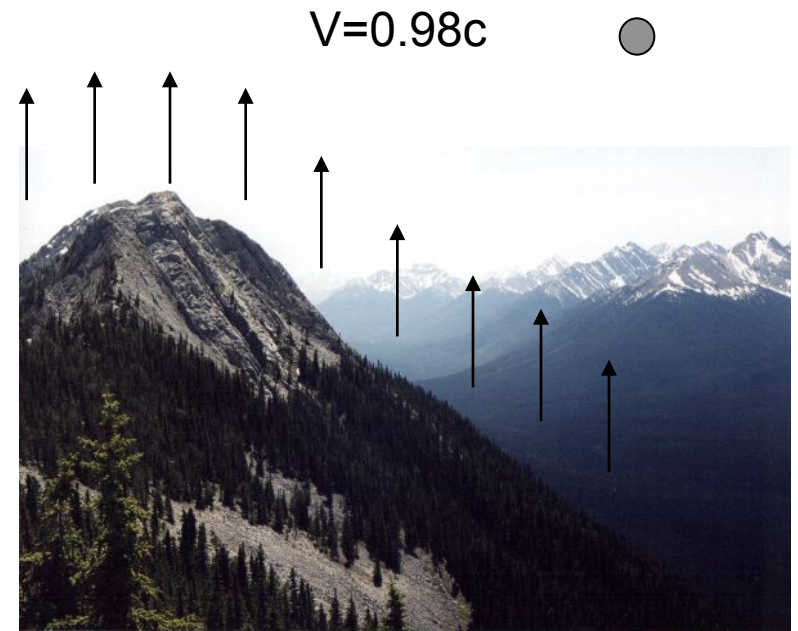

- **As viewed in the earth reference frame**
 - The landscape has its normal size.
 - If muons had size → is flattened like a pancake.
 - Muon's clock run 5 times slower.
- **As viewed in the muon's reference frame**
 - If muons had size → muon has its normal size.
 - The landscape (moving) is flattened like a pancake.
 - Muon's clock runs normally. But distance is 5 times shorter.

Time dilation in muons

Muon traveling at 0.98c down the atmosphere

- **As viewed in the earth reference frame**
 - The landscape has its normal size.
 - If muons had size → is flattened like a pancake.
 - Muon's clock run 5 times slower.
- **As viewed in the muon's reference frame**
 - If muons had size → muon has its normal size.
 - The landscape (moving) is flattened like a pancake.

Time dilation in muons

Muon traveling at $0.98c$ down the atmosphere

As viewed in the earth reference frame

- The landscape has its normal size.
- If muons had size \rightarrow is flattened like a pancake.
- Muon's clock run 5 times slower.

As viewed in the muon's reference frame

- If muons had size \rightarrow muon has its normal size.
- The landscape (moving) is flattened like a pancake.
- Muon's clock runs normally. But distance is 5 times shorter.

Time dilation in muons

Muon traveling at $0.98c$ down the atmosphere

As viewed in the earth reference frame

- The landscape has its normal size.
- If muons had size \rightarrow is flattened like a pancake.
- Muon's clock runs 5 times slower.

As viewed in the muon's reference frame

- If muons had size \rightarrow muon has its normal size.
- The landscape (moving) is flattened like a pancake.
- Muon's clock runs normally. But distance is 5 times shorter.

Both frames predict the same results: muon decays at the base

Light carries momentum

- Shooting a pulse of light to a cannonball

Light carries momentum

- Shooting a pulse of light to a cannonball

What is going to happen ?

- Let's find out. Rules of the game
 - Conserve Energy
 - Conserve Momentum
 - Photons have intrinsic momentum
 - Momentum of massive particle: $\text{mass} \times \text{velocity}$
- Given these two rules, only one thing can happen...

Light carries momentum

...the photon pulse gives its momentum to the cannonball !

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- In r.f. S' we shoot energy towards a ball

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Photons hit the ball from behind → Momentum of the ball must have changed !

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Photons hit the ball from behind → Momentum of the ball must have changed !

But velocity did not change !

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Photons hit the ball from behind → Momentum of the ball must have changed !

But velocity did not change !

If the momentum of the ball ($=m \times v$) changed, but the velocity did not ...

Mass and Energy in Relativity

- In r.f. S' we shoot energy towards a ball

- Momentum from both flashlights cancel each other.
- As photons hit the ball, its state of movement does not change.
- The ball gets warmer, it has more energy.

- From the r.f. S (moving w.r.t. to S') we see this differently

Photons hit the ball from behind → Momentum of the ball must have changed !

But velocity did not change !

If the momentum of the ball ($=m \times v$) changed, but the velocity did not ...

Mass changed!. Mass and energy are related! Einstein found that $E=mc^2$!

Simultaneity in Relativity

- Assume E_1 and E_2 are simultaneous (or $t_1 = t_2$)

- In the moving reference frame:

$$\Delta x' = \gamma \Delta x$$

$$c\Delta t' = -\gamma\beta \Delta x$$

The two events are not seen as simultaneous!

- If $V > 0$ (as drawn) E_2 happens first, later E_1
- If $V < 0$ E_1 happens first, later E_2
- Event in the direction of the moving r.f. happens first, in this case E_2

- Can these two events be related, can one be the cause of the other one ?

No! There is no signal that can cover the distance ΔX in no time!

Paradox #1: Car and garage (0)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

Paradox #1: Car and garage (0)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

Paradox #1: Car and garage (0)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

Paradox #1: Car and garage (0)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

- Car driver's perspective; "*Garage looks shorter, it won't fit !!!*"

Paradox #1: Car and garage (0)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

- Car driver's perspective; "*Garage looks shorter, it won't fit !!!*"

Who's right ? The guy in the garage or the driver ?

Paradox #1: Car and garage (1)

- Both sentences are right. The car “will fit” and “will not fit” in the garage.
- What’s the definition of fit ?

This definitely fits!

This too!

- Does this fit ?

This definitely No

- The car fits in the garage if: the car is within the doors when both doors have been closed **SIMULTANEOUSLY** .
 - “Fit” requires the concept of simultaneity.
 - Simultaneity is a frame-dependent concept.
- The “**fit**” mentioned by the driver and the garage-guy represent different things!

Paradox #1: Car and garage (2)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

Paradox #1: Car and garage (2)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

Paradox #1: Car and garage (2)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

Paradox #1: Car and garage (2)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- How does the car driver see the closing of the doors?

Paradox #1: Car and garage (2)

- Car fits perfectly in garage. Car is set at distance d coming with velocity V . Garage set to close doors in d/V seconds.

- Car and garage moving with respect to each other

- Guy in garage's perspective: "*Car looks shorter, no problem, it'll fit in.*"

- How does the car driver see the closing of the doors?

No matter where you see it from the results are the same

Hints of General Relativity

General Relativity: Principles

- Special relativity is valid only in Inertial reference frames.
 - Einstein wasn't happy with that. He sought to extend the principle of relativity to ALL frames of reference. He noticed :

Principle of equivalence

Accelerated frame and frame at rest with a gravitational pull are equivalent in every respect

➤ Non relativistic Doppler effect:

➤ $f' = f / (1 + V/c)$

➤ Relativistic Doppler effect:

➤ Include that the moving observer's clock runs slower by γ

➤ $f' = f / [\gamma (1 + V/c)]$

Light frequency is relative to the observer!

- Let's consider an **accelerated** frame. From doppler effect
 - A photon of frequency f is emitted from the floor.
 - It is detected in the ceiling with frequency $f' < f$

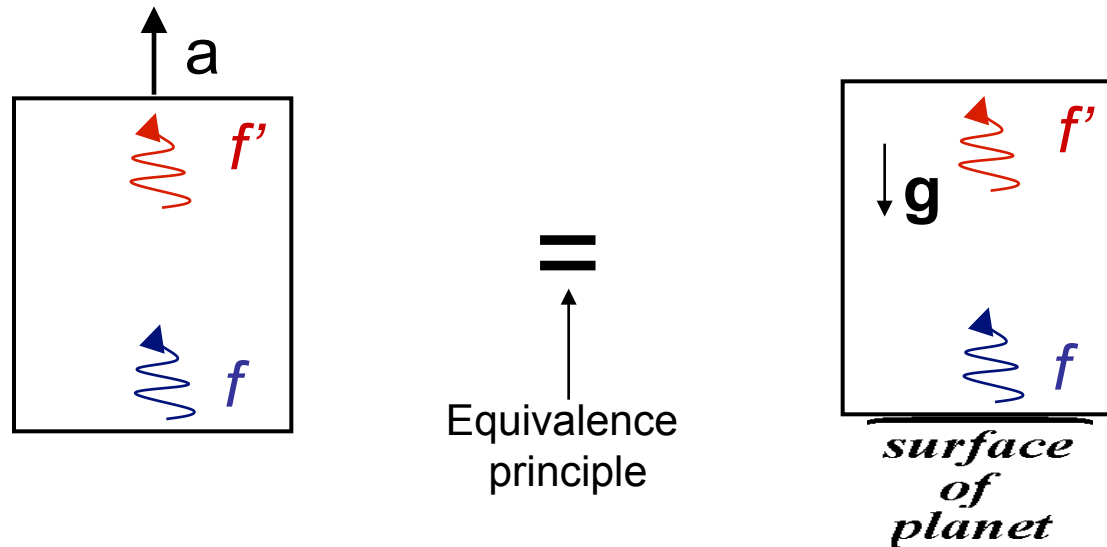

General Relativity: Clocks in gravity fields

- Let's consider an **accelerated** frame. From doppler effect
 - A photon of frequency f is emitted from the floor.
 - It is detected in the ceiling with frequency $f' < f$

General Relativity: Clocks in gravity fields

- Let's consider an **accelerated** frame. From doppler effect
 - A photon of frequency f is emitted from the floor.
 - It is detected in the ceiling with frequency $f' < f$

Clocks close to a massive body run slower than clocks farther away

General Relativity: Clocks in gravity fields

- Let's consider an **accelerated** frame. From doppler effect
 - A photon of frequency f is emitted from the floor.
 - It is detected in the ceiling with frequency $f' < f$

Clocks close to a massive body run slower than clocks farther away

Experimentally verified by many “Tower Experiments”

➤ Is the space curved ?

Q: is earth curved ?

A1

A2

➤ Is the space curved ?

Q: is earth curved ?

A1

A2

A1: Sum internal angles of triangle greater than 180.

A2: Circumference c of a circle is less than $2\pi r$

➤ Is the space curved ?

Q: is earth curved ?

A1

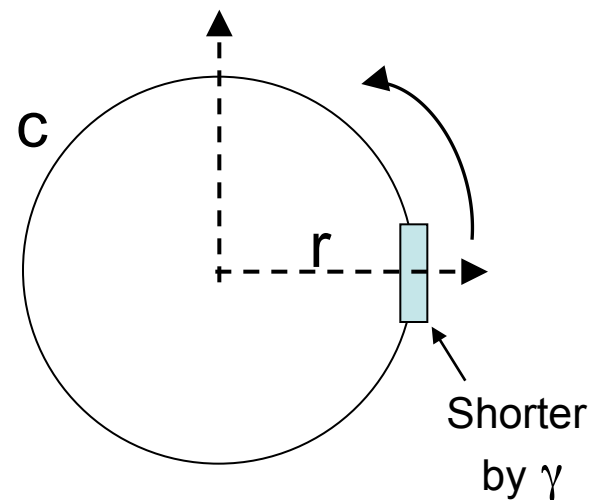

A2

A1: Sum internal angles of triangle greater than 180.

A2: Circumference c of a circle is less than $2\pi r$

Q: is space-time curved ?

A: circumf. of circle is not $2\pi r$!!

General relativity: the bending of space

➤ Is the space curved ?

Q: is earth curved ?

A1

A2

A1: Sum internal angles of triangle greater than 180.

A2: Circumference c of a circle is less than $2\pi r$

Q: is space-time curved ?

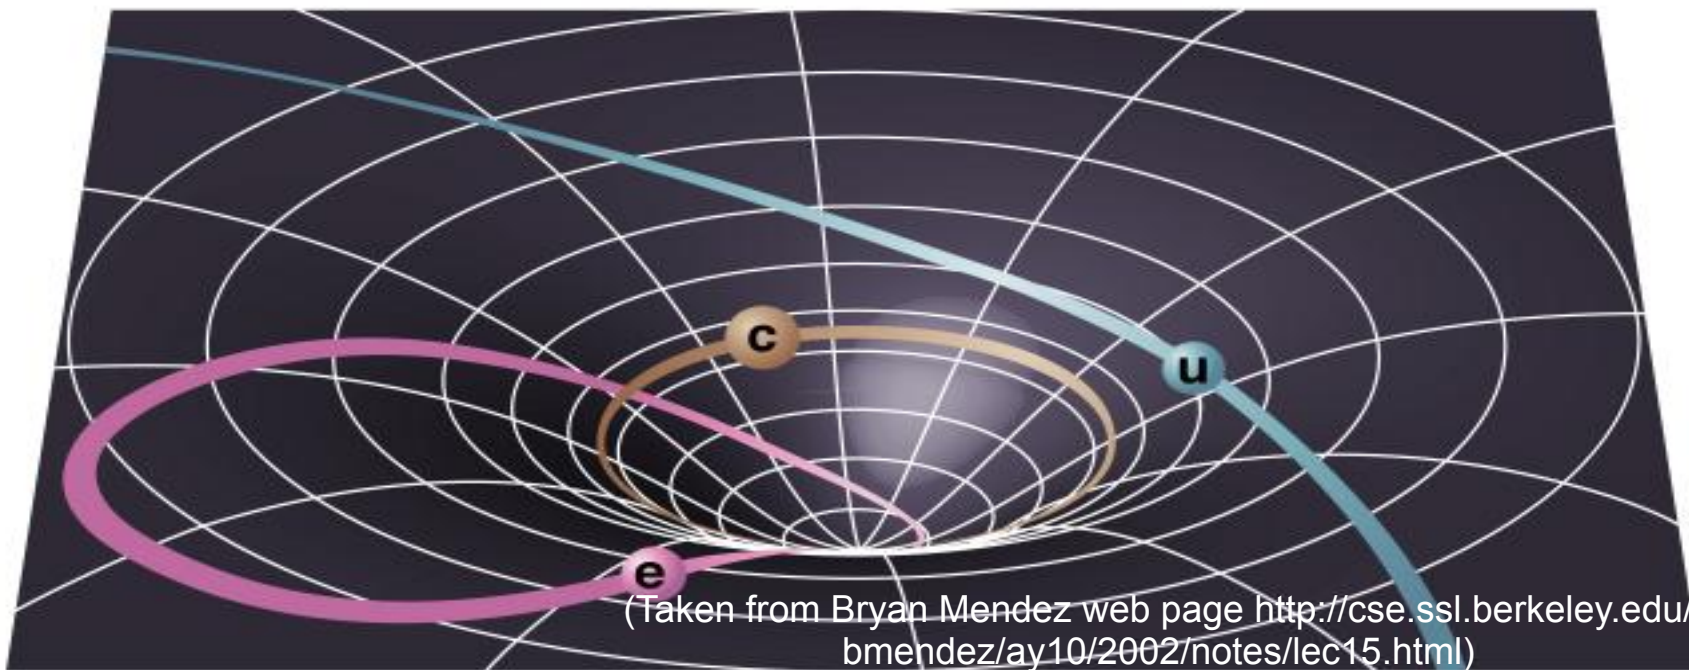

A: circumf. of circle is not $2\pi r$!!

Einstein concluded: Space-time must be curved !

General Relativity: in a nutshell

- **Massive objects curved space-time.**
 - The more massive the greater the curvature.
 - The greater the curvature the more intense the gravity.
- **Objects move following the shortest path in curved space-time.**
